(A) Fixed **G**, rotating **b**
$\mathbf{b}_3$
$\mathbf{b}_2$
$\mathcal{A}_g \approx 0.28$
$\mathcal{A}_g \approx 0.63$
θ
$\mathbf{b}_1$
a_2
$\bar{\mathbf{z}}$
$\mathcal{A}_g \approx 0.78$
$\mathbf{g}_{\max}$
breeding value a_1
(B) $\mathcal{A}_g$ declines with gradient rotation
$\lambda_1/\lambda_2 = 1.5$ (never exits)
$\lambda_1/\lambda_2 = 2$ (marginal)
$\lambda_1/\lambda_2 = 3$
$\lambda_1/\lambda_2 = 5$
α
$\mathcal{A}_g(\theta)$
gradient angle θ (degrees)
(C) Exit angle θ^* vs curvature load
$\kappa_0^{\max} = \frac{1-\alpha}{\alpha}$
exit angle θ^* (degrees)
curvature-to-gradient ratio $\kappa_0 = V_{\text{quad}}/V_{\text{lin}}(0°)$
